

SECURE QR CODE MESSAGE TRANSMISSION SYSTEM

Wireshark Network Capture – Actual Output

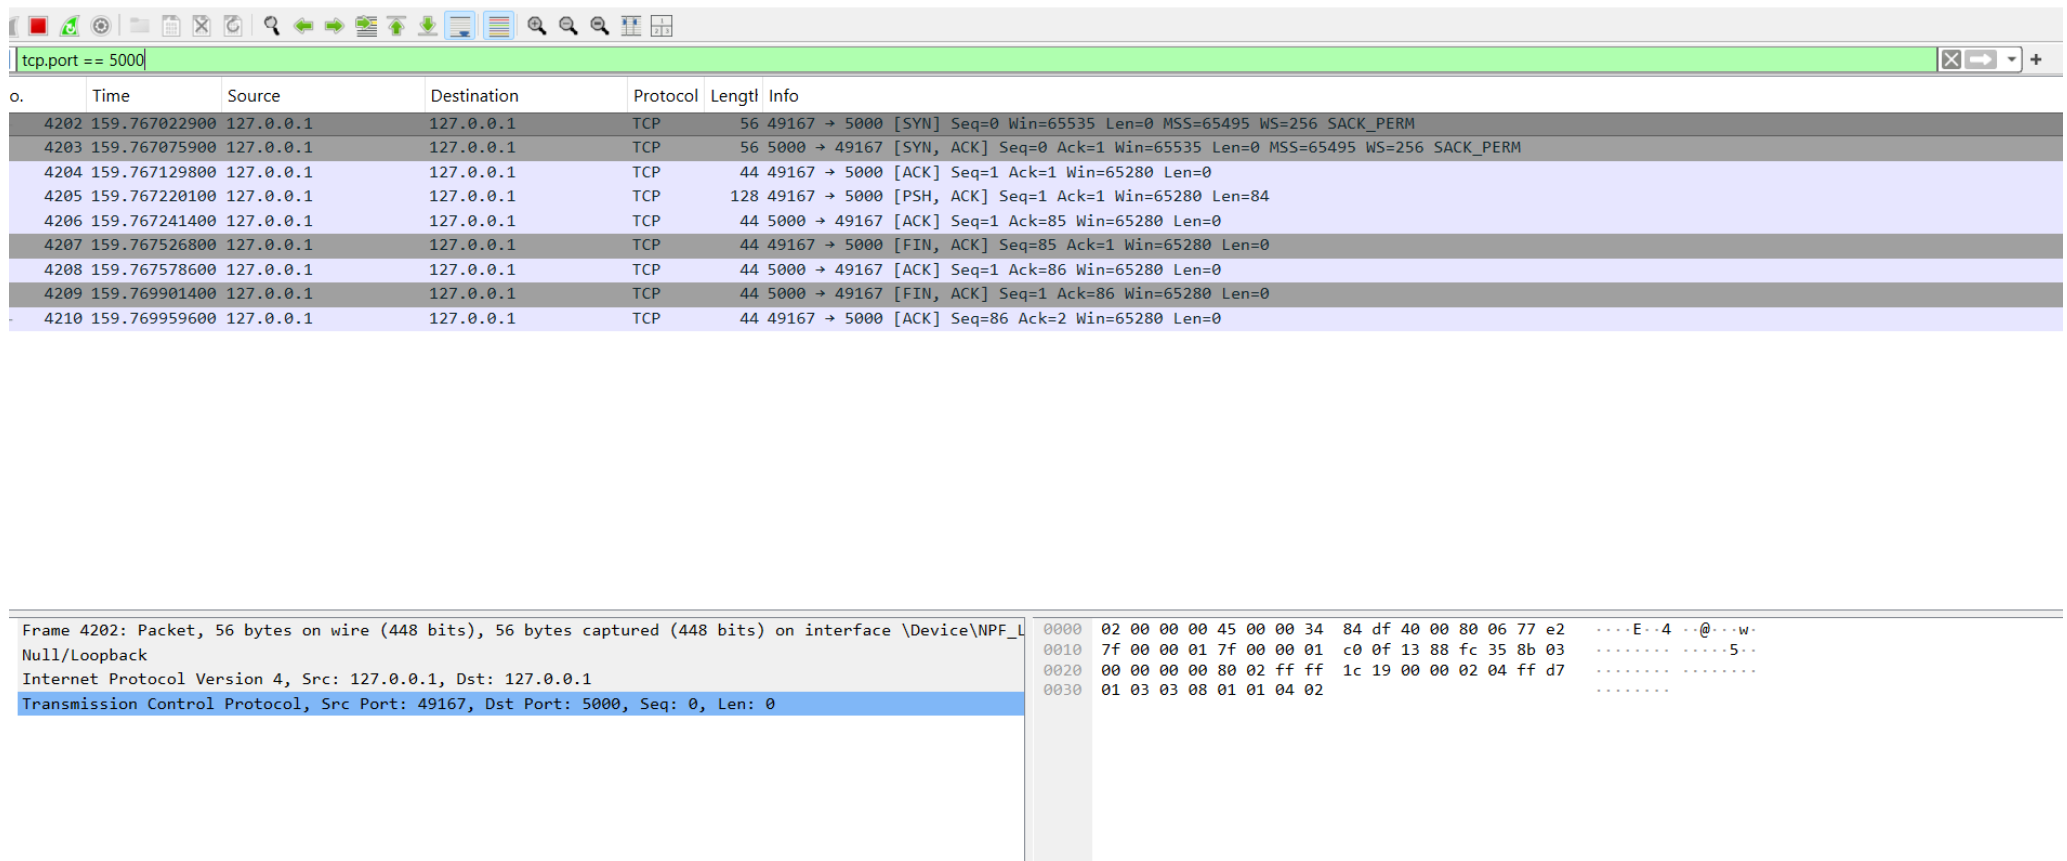

Figure: TCP packets captured using Wireshark on the Loopback interface with the display filter `tcp.port == 5000`.

Observation: The screenshot shows TCP communication between **127.0.0.1** and TCP port **5000**. The packet list contains the TCP connection establishment, data transfer, acknowledgement and connection termination packets. The selected packet also shows the TCP source port **49167** and destination port **5000**.

Result: Wireshark successfully captured the network traffic generated by the secure message transmission program. The packet capture can be used to demonstrate that the encrypted data is transmitted through TCP.
